

Pediatric Orthopedics-

From Flat Heads to
Crooked Feet and Curvy
Spines in Between

Marcie Fitzgerald, MPAS, PA-C, DFAAPA

I do not have any financial
or relationships to disclose
regarding my presentation

A dark grey arrow points to the right from the left edge of the slide. Below it, several thin, curved lines in shades of blue and grey sweep across the left side of the slide.

Intoeing

- ▶ Foot-Metatarsus Adductus
- ▶ Lower leg-Internal Tibial Torsion
- ▶ Upper leg-Femoral Anteversion

Packaging Issues

- Metatarsus Adductus
- Internal Tibial Torsion
- Physiologic genu varum
- Torticollis
- Hip dysplasia

Metatarsus Adductus

- Adduction of the forefoot resulting in intoeing
- Epidemiology
 - 1st born more common
 - Equal occurrence with gender
 - May be associated with hip dysplasia and other molding disorders
- Treatment usually not necessary

NOT to be
confused
with
Clubfoot

► **Talipes Equinovarus**

1. Rigid
2. Hind and midfoot are varus
3. Forefoot adductus
4. Calf atrophy
5. Hypoplasia of tibia, fibula and foot bones

► Treated with serial casting

Know the difference!

Metatarsus Adductus

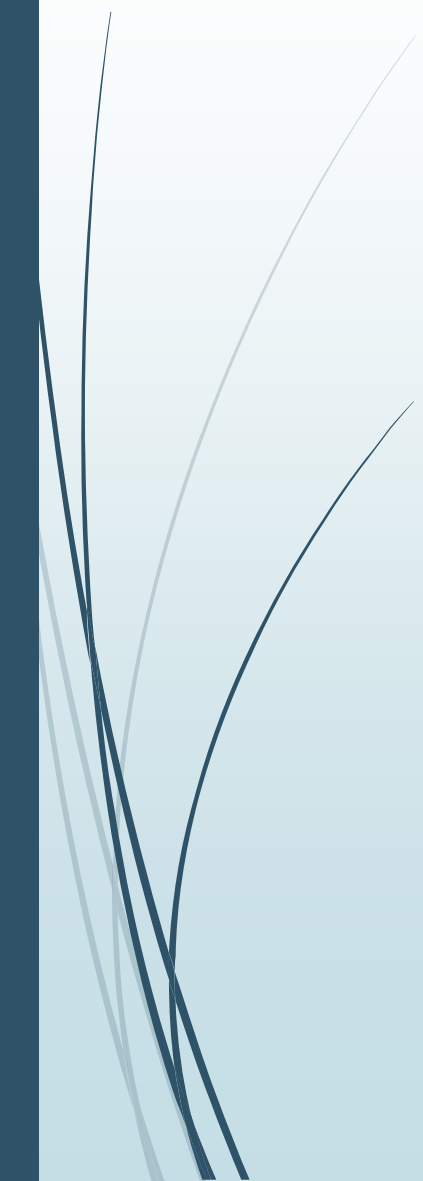

- ▶ Flexible ankle
- ▶ No hindfoot deformity
- ▶ Forefoot adductus
- ▶ Child usually grows out of it

Clubfoot

- ▶ Ankle equinus
- ▶ Hindfoot varus
- ▶ Forefoot adductus
- ▶ Requires casting, bracing, surgery

Internal Tibial Torsion

- ▶ Tibias are rotated inward
 - ▶ Patellas are straight
 - ▶ Usually resolves without treatment by age 2
- 

Femoral Anteversion

- ▶ Femur rotated internally
- ▶ Causes patella and feet to point inward
- ▶ Peaks around age 3
- ▶ Resolves with growth by age 8-9

Torticollis

Tightness of one of the Sternocleidomastoid muscles

Decreased ROM of baby's neck

Can develop skull and facial deformities

Treat with PT

Sometimes need helmet for molding

Hip problems

- Developmental Dysplasia
- Leg Calve Perthes
- Slipped Capital Femoral Epiphysis
- Transient Synovitis
- Septic Arthritis

Developmental Dysplasia of the Hip

- ▶ AKA DDH, Congenital Hip Dysplasia
- ▶ Epidemiology
 - ▶ First born
 - ▶ Female
 - ▶ Frank breech birth
 - ▶ Oligohydramnios
 - ▶ Associated with estrogen from mom, packaging

DDH

- Clinical Manifestation
 - Positive Barlow's
 - Positive Ortolani's
 - Extra skin folds
 - Shorten extremities
 - Uneven knee levels (Galeazzi Sign)
 - Asymmetric abduction

Dx of DDH

- Clinical exam
- AP X-ray after 3 months of age
- Hip ultrasound prior to 3 months

Legg-Calve-Perthes

Etiology

- Idiopathic osteonecrosis or avascularization of the CFE
- Bone growth deficiency is caused by decreased CFE blood supply

Epidemiology

- Males > Females 4-5:1
- Only 20% are bilateral
- Age of onset is 2-12 years, with a mean age at 4-8 years

Legg Calve Perthes

Clinical Manifestation

- Classic presentation is a “painless limp”
- May have mild pain
- Disproportional growth and short stature
- Proximal thigh atrophy

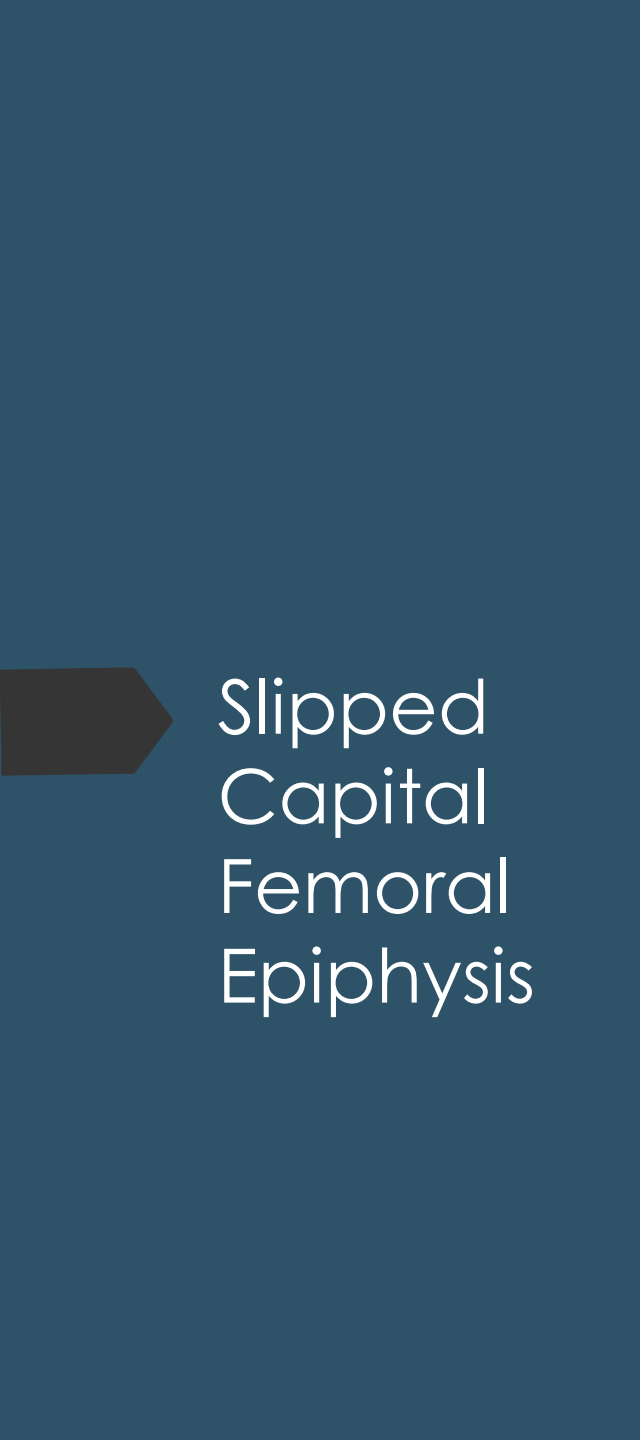

Lab/Diagnostic

- Hip X-ray

Legg Calve Perthes

► Treatment

- Treatment is aimed at preventing femoral head deformity and OA
- Rest, PT and strengthening exercises
- Containment (Scottish-Rite Brace)
- Casting and surgery

Slipped Capital Femoral Epiphysis

- ▶ AKA SCFE
- ▶ Epidemiology
 - ▶ Boys (age 13-15) > Girls (age 11-13)
 - ▶ Usually overweight
 - ▶ Can be associated with endocrine d/o (Hypothyroidism, hypogonadism)

SCFE

- ▶ Signs and Symptoms
 - ▶ Hip pain
 - ▶ Can c/o knee or groin pain
 - ▶ Limp
 - ▶ External rotation of leg
 - ▶ Pain with internal hip rotation

A dark grey arrow points to the right from the left edge of the slide. Several thin, curved lines in shades of blue and grey originate from the left side and sweep across the slide towards the right.

Goals of Treatment

- ▶ **Containment**
- ▶ **Prevention of further slippage**
- ▶ **Avoidance of AVN**

Treatment-

Percutaneous pinning

Transient Synovitis

- Occurs when a systemic virus decides to hang out in the hip
- Hip pain, unable to weight bear, limping
- Could have a fever
- Pelvis x-ray is normal
- CRP, Sed rate is usually elevated
- CBC with diff is normal
- No treatment

Septic Arthritis

- ▶ Hip pain, fever, inability to weight bear, limp
- ▶ The kid looks sick
- ▶ White count, Sed rate, CRP are elevated
- ▶ Medical emergency!
- ▶ Surgery for open debridement and washing out, IV antibiotics post op
- ▶ Failure to treat promptly results in degradation of hip joint

Types of Scoliosis

Congenital

Neuromuscular

Idiopathic

Congenital

- Usually caused by a malformation of the vertebra
- Can be diagnosed on prenatal ultrasound
- Usually diagnosed by physical exam of the infant and x ray

Neuromuscular

- Associated with a neuromuscular condition (CP, MD, genetic syndromes)
- Usually long, sweeping curves

A dark grey arrow points to the right from the left edge of the slide. Below it, several thin, curved lines in shades of blue and grey sweep across the left side of the slide.

Idiopathic

- ▶ Most common type
- ▶ We don't know why it happened
- ▶ These curves are usually S shaped
- ▶ Classified by age at diagnosis
 - ▶ Infantile-birth to age 3
 - ▶ Juvenile-ages 4-10
 - ▶ Adolescent-ages 11-17

Important history questions

- ▶ Who noticed curvature? When?
- ▶ Any back pain?
- ▶ Any numbness or tingling in arms or legs?
- ▶ Any bowel or bladder problems?
- ▶ Have you had first period yet? (girls only)
- ▶ Any family history of scoliosis?

Physical Exam

- ▶ Adam's forward bend-scoliometer
- ▶ Brief neuro exam
 - ▶ Walk on toes, heels
 - ▶ Hop on one foot
 - ▶ Squat down and come up
 - ▶ Abdominal reflexes
 - ▶ Babinski reflex

X Ray

- ▶ Order PA and Lateral of entire spine
- ▶ Measure the Cobb angle
 - ▶ 0-10 degrees = Spinal Asymmetry
 - ▶ 11-20 = Mild Scoliosis
 - ▶ 21-40 = Moderate Scoliosis
 - ▶ 40-50 = Severe Scoliosis
 - ▶ >50 = Surgery

Cobb Angles

- ▶ Cobb angles are measured by drawing a line at the bottom of the vertebra that is most tilted
- ▶ A second line is drawn on the top of the vertebra that is tilted the most in the opposite direction
- ▶ A line is then drawn perpendicular to each of the lines and the angle that is formed is the measurable Cobb angle

A dark grey arrow points to the right from the left edge of the slide. Several thin, curved lines in shades of blue and grey originate from the left side and sweep across the slide towards the text.

Adolescent Idiopathic Scoliosis

- ▶ Dx 11-17
- ▶ MC in girls
- ▶ Curves <20 degrees, monitor q 6 months
- ▶ Curves 20-30 consider bracing (factor in pts maturity)
- ▶ Curves >30 brace, continue to monitor q 6 mo
- ▶ Curves > 50 surgery (Posterior Spinal Fusion)
