Anaphylaxis is an acute, potential life-threatening systemic allergic reaction that may have a wide range of clinical manifestations. Severe anaphylaxis and/or the need for repeated

doses of epinephrine to treat anaphylaxis are risk factors for biphasic anaphylaxis. Antihistamines and/or glucocorticoids are not reliable interventions to prevent biphasic anaphylaxis,

# ***ANAPHYLAXIS***

**In a few seconds it was extremely ill; breathing became distressful and panting; it could scarcely drag itself along, lay on its side, was seized with diarrhea, vomited blood and died in twenty-five minutes.**

Charles Richet 1902

# ***ANAPHYLAXIS***

Instead of inducing tolerance (prophylaxis),

**Richet's** experiments in dogs injected with

sea anemone toxin resulted in lethal

responses to doses previously tolerated.

He coined the word 'ana' (without) 'phylaxis

(protection). He won the Nobel prize for this

work.

CHARRIÉ FICHET

1901

# *Definition of Anaphylaxis*

- An acute allergic reaction resulting in widespread allergic symptoms which involves two or more organ systems, and is potentially life-threatening, resulting from an **IgE**-mediated mechanism.
- Anaphylactoid – term falling into disuse but meant to describe anaphylaxis without **IgE** involvement ie a non-allergic mechanism.
- Anaphylaxis now describes a clinical event, regardless of mechanism

## ***Current Definition of Anaphylaxis***

Two or more of the following that occur rapidly after exposure to a likely allergen for the patient:

- (i) involvement of skin-mucosal tissue
- (ii) respiratory involvement
- (iii) reduced blood pressure or associated symptoms
- (iv) gastrointestinal symptoms

Also - reduced blood pressure as a result of exposure to a known allergen trigger.

# *Current Definition of Anaphylaxis*

## **Couple thoughts –**

Histamine (and others) are driving this. How much is going to be released?

What volume of histamine is needed to cause anaphylaxis? Will this happen?

Meeting Criteria NOT needed to administer epinephrine

Let these thoughts help you and your patients

# ***IS THIS ANAPHYLAXIS?***

12 YO MALE with an insect sting (stung once) at a park. Had the following:

Hives, tongue felt thick but did not look swollen

Cough, a bit of a wheeze and chest felt tight

Runny nose and sneezed once

Felt nausea and like

“he was going to throw up”

Hands and feet felt swollen

# ***IS THIS ANAPHYLAXIS?***

12 YO MALE with an insect sting (stung once) at a park. Had the following:

Hives, tongue felt thick but did not look swollen

Cough, a bit of a wheeze and chest felt tight

# ***IS THIS ANAPHYLAXIS?***

12 YO MALE with an insect sting (stung once) at a park. Had the following:

Hives, tongue felt thick but did not look swollen

# ***WHO ARE THE PLAYERS?***

What brings this on?

# Mast Cells

- **Mast cells** are abundant in the mucosa of the respiratory, gastrointestinal tracts and in the skin
- **Mast cells** release mediators that cause the pathophysiology of the immediate and late phases of atopic diseases.
- Histamine is the major player but there are many others

# Mechanism

- While first-time exposure may only produce a mild reaction, repeated exposures may lead to more serious reactions. Once a person is sensitized (has had a previous sensitivity reaction), even a very limited exposure to a very small amount of allergen can trigger a severe reaction.
- Most occur within seconds or minutes after exposure to the allergen, but some can occur after several hours, particularly if the allergen causes a reaction after it is partially digested. In very rare cases, reactions develop after 24 hours (alpha-gal and scombroid) .

# The allergic response

The three stages of an IgE-mediated allergic reaction

# ***ACTIONS OF HISTAMINE***

- ***Peripheral vasodilation***
- ***Increased vascular permeability***
- ***Increased heart rate***
- ***Bronchial/intestinal smooth muscle contraction***
- ***Nerve stimulation-Cutaneous pruritus/pain***
- ***Increased glandular mucus secretions***

# ***CLINICAL MANIFESTATIONS OF ALLERGY***

- ***Vasodilation – erythema, nasal congestion, hypotension***
- ***Increased vascular permeability – urticaria, hypotension***
- ***Smooth muscle spasm – asthma, intestinal cramps, diarrhea***
- ***Mucus secretion – allergic rhinitis, asthma***
- ***Nerve stimulation-itch, sneeze***

Confusion, headache  
or loss of consciousness

Wheezing, cough  
or difficulty  
getting air

Swollen eyes

Swollen lips  
or tongue

Hives

Fast heart rate

Abdominal  
pain or vomiting

buoy

# **URTICARIA**

- *Raised central white or red wheals*
- *Surrounding erythema or flare, with itch or burning*
- *Histamine mediated*
- *Varies in shape & size – circular, gyrate, linear, isolated or coalescent*
- *Well demarcated, blanch with pressure*
- *Predisposition to warm areas, pressure sites*
- *Lasts hours, max 24 - 48*

# ***ANGIOEDEMA***

- **Diffuse skin colored subcutaneous swelling**
- **Pathology similar to urticaria except it occurs in deeper subcutaneous tissues**
- **Not itchy or painful, unless in confined site**
- **Can be histamine, bradykinin etc mediated**
- **Can last hours or days**
- **Not very responsive to antihistamines**
- **Approx 40% of urticaria cases**

# ***ANAPHYLAXIS: OVERVIEW***

- Anaphylaxis is a **severe**, potentially fatal systemic allergic reaction that occurs suddenly (minutes to hours) after contact with an allergy-causing substance
- Death can occur in **minutes**, usually due to closure of airways
- Allergic reaction affects many body systems : rash & swelling, breathing difficulties, vomiting & diarrhea, heart failure & low blood pressure  
→ ANAPHYLACTIC SHOCK

# Girl, 14, dies after sampling sauce

Undetected allergy  
to peanuts fatal

By Tony Lofaro  
*Citizen staff writer*

Christiane Guay enjoyed most foods, though like many teenagers she balked at eating broccoli or Brussels sprouts. But the thing she hated most was the smell and taste of peanuts, and purposely avoided them.

The 14-year-old student at Lester B. Pearson High School in Gloucester had no inkling a normal meal made with peanut sauce, prepared by her mother, Jacqueline, would prove to be deadly.

At the family dinner table Wednesday night, Christiane sat with her mother, her sister, Marie-Lyne, 17, and brother, Mathieu, 16, and sampled a mere teaspoon of a peanut sauce dish.

It was enough to bring on an immediate violent reaction. Her throat swelled and blocked her breathing before she passed out on the kitchen floor of her Ogilvie Road home.

She was rushed to the Children's Hospital of Eastern Ontario and was placed on a life-support system. She died a few days later after her heart stopped. Christiane, an asthmatic sufferer, had an anaphylactic reaction to the peanut sauce. CHEO doctors told the family.

On average, three children per year in Ontario die from an allergic reaction to food, although there could be more because many deaths are probably not reported that way, says a local pediatric allergist. The most serious kinds of allergic reactions affect about 150,000 Canadians.

After Christiane's death, her family acted quickly and donated her heart, lungs and kidneys to two patients in London, Ont.

The girl's father, Jacques Guay, was working in Thunder Bay when the accident happened.

**GIRL** continued on page A2

Christiane Guay disliked peanuts and avoided them, but her family never had any reason to believe she had an allergy

## Peanut, other allergies can surface at any time

*Chen and*

Peanut and other allergies can suddenly become life-threatening long after infancy, an Ottawa pediatric allergist says.

The fact that a person did not have a serious reaction in the past does not rule out a life-threatening reaction later, Dr. Antony Ham Pong warned on Monday. And, in a fact sheet he has prepared for parents, Ham Pong says that in cases where mild allergic reactions have occurred in the past, severe reactions can occur later with the same

amount of food.

Ham Pong said that in recent years, he has been seeing more cases of children developing a reaction to peanuts.

The influx of patients at his Russell Road practice is largely due to a greater public awareness of the dangers of peanut allergies, he said.

While the bulk of his patients are children under five, the biggest increase is among children under three years of age.

## Mom's heartbreaking warning after 11-year-old daughter dies from allergic reaction to toothpaste

Elizabeth Di Filippo

Yahoo Canada Style April 17, 2019

Follow

Denise Saldate and her mother, Monique Altamirano. Image via Facebook.

The mother of an 11-year-old girl who died after an allergic reaction to toothpaste is sharing her story.

The family of Denise Saldate is in mourning after her sudden death caused by a reaction to a milk protein in prescription toothpaste.

The West Covina, Calif. girl died on April 6, just two days after she received a prescription for MI Paste One brand of medicated toothpaste to help strengthen her tooth enamel.

- Cardiac Dysfunction (24%)***

- My quick “Jimmy” biphasic story -

# ***BIPHASIC ANAPHYLAXIS***

# ***BIPHASIC ANAPHYLAXIS***

- Biphaseic anaphylaxis is a recurrence of anaphylaxis after appropriate treatment and complete resolution of symptoms.
- It happens with no additional exposure to the allergen.

# ***BIPHASIC ANAPHYLAXIS RATES***

Study	# Biphasic	# Total	% Biphasic	Notes
Popa & Lerner, 1984	3	N/A	N/A	coined term biphasic anaphylaxis
Stark & Sullivan, 1986	5	25	20%	epinephrine was given SQ
Douglas et al, 1994	6	103	5.8%	
Brady et al, 1997	2	67	3%	first to include return ED visits
Brazil & MacNamara, 1998	6	34	18%	range 4.5 - 29.5 hours, biphasic group initially required mean 1.2mg vs 0.6mg epinephrine
Lee & Greenes, 2000	6	105	6%	first study of children
Forrest-Hay et al, 2003	9	91	9%	8 within 6 hours, 1 at 35 hours
Ellis & Day, 2004	20	103	19.4%	40% occurred 10+ hours later, 55% biphasic never received epi (compared to 82% uniphasic)
Smit et al, 2005	15	282	5.3%	Hong Kong, mean 7.6 hours (range of 1.2 - 22.5 hours)

***Accepted numbers – 5-8%***

# ***BIPHASIC ANAPHYLAXIS***

- Million-dollar question – who is at high risk of this?

# ***BIPHASIC ANAPHYLAXIS***

- Anaphylaxis to an unknown trigger – OR 1.6
- More than one dose of epinephrine to stop the first round of symptoms – OR 4.6
- Wide Pulse Pressure – OR 2.1
- Significant skin symptoms OR 2.4
- Time to first epinephrine dose – OR 2.2  
*(Ave 130 min for the biphasic group, 53 min monophasic)*
- Kids – drug cause, risk higher. Food cause, risk lower?
- Severe Anaphylaxis OR 2.1 – *highly variable in the literature but hypotension and 3 organ systems good indicators*

# ***BIPHASIC ANAPHYLAXIS***

- Second million-dollar question – how long to hold patients?
- Recommendations are:
  - If you are in a facility that is comfortable treating this then keeping a low risk patient till they are free of symptoms and then d/c is reasonable. About 1-2 hours.
  - This assumes epinephrine on hand, reliable patients/parents, good transportation, comfort with epinephrine auto injection

# ***BIPHASIC ANAPHYLAXIS***

- Second million-dollar question – how long to hold patients?
- Recommendations are:
  - For high risk patients, the golden number is 6 hours. At this point 90% of the biphasic reactions will have occurred.

# ***BIPHASIC ANAPHYLAXIS***

- Give steroids and antihistamines to prevent biphasic reactions?
- No.
- Not for this.
- You can give them, and should.
- But not for this. Just don't say this is why. Keep that to yourself. Don't chart it.

*Changing Gears – lets diagnose  
and treat*

**KEEP  
CALM**

**AND**

**CARRY  
EPIPENS**

Anaphylaxis:

Rapid recognition and **treatment**

# ***GENERAL MANAGEMENT OF ANAPHYLAXIS***

- **Airway**
- **Breathing**
- **Circulation**
- **But use epinephrine promptly**

# Fatal anaphylaxis: risk factors

- **Concomitant asthma**
- **No epinephrine**
- **Non effective epinephrine**
- **Other cardiopulmonary disease**

# ***Initial Anaphylaxis Treatment***

- **Epinephrine (adrenaline) is first line treatment**
- **Epinephrine IM**
- **Antihistamines & bronchodilators are not first line treatment but may be given after epinephrine.**
- **Once epi is given then throw everything else you have at them . . . .**

# ***Initial Anaphylaxis Treatment***

- **We give kids 5-20 mg prednisone PO for 2 days**
- **Adults 40 mg PO for 2 days**
- **Cetirizine 10 mg BID for 2 days**
- **Ranitidine 150 mg BID for 2 days**
- **Step up inhaler therapy if indicated, move SABA to Q4H instead of PRN**
- **Refill their epinephrine auto injectors**
- **This is highly customizable. . . .**

# ***Management of anaphylaxis: Initial***

- **Epinephrine 0.01mg/kg (max 0.5mg) IM X3, every 5-20min as needed. In severe cases epinephrine IV**
- **H1 antagonists Diphenhydramine (Benadryl) 25-100mg**
- **H2 antagonists eg ranitidine**
- **IV fluids, O2 etc if in hospital**
- **Corticosteroids**

# *Management of anaphylaxis: Bronchospasm*

- **SVN albuterol**
- **Oxygen**
- **Intubation and ventilation if needed**

# ***Management of anaphylaxis: Hypotension***

- **Trendelenberg position**
- **Volume expansion with crystalloid**
- **Vasopressors eg dopamine,  
norepinephrine, vasopressin**
- **Glucagon if on  
beta-blocker**

# ***Treatment of Anaphylaxis in Beta Blocked Patients***

- **Give epinephrine initially.**
- **If patient does not respond to epinephrine and other usual therapy:**
- **Glucagon 1 mg IV over 2 minutes**

# ***EFFECTS OF EPINEPHRINE***

- **Increases BP, reverses peripheral vasodilation , ( alpha-adrenergic activity)**
- **Reduces urticaria and angioedema by vasoconstriction (alpha)**
- **Bronchodilation – relaxes bronchial smooth muscle (beta-2 adrenergic activity)**
- **Increases cardiac contractility – force and volume, increasing heart rate & BP (beta-1)**
- **Prevents further mast cell degranulation (beta)**

# ***SIDE EFFECTS OF EPINEPHRINE***

- Epinephrine reverses just about all the harmful aspects of anaphylaxis
- It can take a few minutes but normally you can watch this happen before your eyes

***If you (heaven forbid) should give  
epi when you didn't need to. .  
What bad stuff happens to the  
patient???***

# Who needs to carry an epinephrine autoinjector?

Cleveland Clinic Journal of Medicine. 2019 January;86(1):66-72

Author(s): T. Ted Song, DO, FAAAI, FACP; Phil Lieberman, MD

Author and Disclosure Information

## ABSTRACT

Patients who have had anaphylaxis or who are at risk of it (eg, due to food allergy or *Hymenoptera* hypersensitivity) should carry an epinephrine autoinjector at all times. However, the risks and benefits must be considered on an individual basis, especially in patients with atherosclerotic heart disease, elderly patients on polypharmacy, patients receiving allergen immunotherapy, those with large local reactions to insect stings, and individuals with oral allergy syndrome.

 PDF DOWNLOAD

## KEY POINTS

- Based on current data, there is no absolute contraindication to epinephrine for anaphylaxis. And failure to give epinephrine promptly has resulted in deaths.
- Clinicians concerned about adverse effects of epinephrine may be reluctant to give it during anaphylaxis.
- Education about anaphylaxis and its prompt treatment with epinephrine is critical for patients and their caregivers.

<b>Symjepi</b>	0.3 mg	Price not yet available; launch date unknown. One prescription includes two syringes.	See <b>manufacturer's website</b> for patient assistance.

# Autoinjector Lacerations

## Conclusion

No linear relationship between time and amount of epinephrine injected or absorbed into muscle tissue was demonstrated. These data suggest that holding the device in place for 1 second is as effective as 10 seconds.

So hold it down as long as it takes to hear the click and register that it's in.

# Alpha Gal – the story of the tick that keeps on biting!

galactose- $\alpha$ -1,3-galactose ( $\alpha$ -Gal)

Following one (or more?) tick bites the saliva of the tick transfers proteins and possible fats coated in alpha-gal that are then recognized by memory B cells

Digestion, absorption and transport to the lymphatic system via the lacteal takes about 4 hours.  
This is when the reaction starts

# 5 EASY WAYS TO INTRODUCE PEANUT FOODS TO YOUR INFANT

[preventpeanutallergies.org](http://preventpeanutallergies.org)

## MIX WITH WATER, FORMULA OR BREAST MILK

Thin 2 tsp. of peanut butter with 2-3 tsp. hot water, formula or breast milk. Allow to cool before serving.

## MIX WITH PRODUCE

Stir 2 tsp. of powdered peanut butter into 2 Tbsp. of previously tolerated pureed fruits or vegetables.

## TEETHING BISCUITS

Teething infants who are older and self-feeding may enjoy homemade peanut butter teething biscuits. Find a recipe for teething biscuits at [nationalpeanutboard.org](http://nationalpeanutboard.org)

## MIX WITH FOOD

Blend 2 tsp. of peanut butter into 2-3 Tbsp. of foods like infant cereal, yogurt (if already tolerating dairy), pureed chicken or tofu.

## PEANUT SNACKS

Give your baby a peanut-containing teething food, such as peanut puffs.

### Remember:

The recommended way to introduce baby-friendly peanut foods depends on each child's individual risk factors. Depending on your child's risk, peanut foods should be introduced according to NIAID guidelines after they've already started other solid foods. Whole nuts should not be given to children under 5 years of age. Peanut butter directly from a spoon or in lumps/dollops should not be given to children less than 4 years of age. This content is not intended to be a substitute for professional medical advice, diagnosis or treatment.

Always seek the advice of your pediatrician.

# 10 FAACTs *about* Food Allergies

- 1** Food allergies affect **15-32 million** Americans, including 6 million children. Studies report that **1 in 13** children and up to **1 in 10** adults in the United States have a food allergy. For children, this averages to **two** children per classroom.
- 2** A food allergy is an **immune system response** to a food that the body mistakenly believes is harmful.
- 3** Eight foods account for 90% of all food allergy reactions: **Peanuts, Tree nuts, Milk, Egg, Wheat, Soy, Fish, & Shellfish**. However, almost any food can cause a reaction.
- 4** There is **no cure** for food allergies and **strict avoidance** is the only way to prevent an allergic reaction.  
**Trace amounts** of an allergen can trigger an allergic reaction in some individuals.
- 5** Past reactions to a food allergy **do not predict future reactions!** Someone can still have a life-threatening reaction to a food they are allergic to, even if they have never had a serious reaction before.
- 6** Symptoms can **develop rapidly** after exposure to an allergen, often within minutes and usually within 30 minutes. However, it can take up to 2 hours for symptoms to occur after exposure to a food allergen.
- 7** Anaphylaxis is a **serious allergic reaction** that comes on quickly and has the potential to become life-threatening. Anaphylaxis requires immediate medical treatment, including an injection of epinephrine and a visit to the emergency room.
- 8** It is important to be deliberate and not hesitate when you have to use epinephrine. The device is **potentially life-saving**. A call to 9-1-1 and a trip to the emergency room should always follow epinephrine administration.
- 9** Individuals at risk should carry **two epinephrine auto-injectable devices** with them at all times AND an **Allergy and Anaphylaxis Emergency Care Action Plan** signed by a board-certified allergist.
- 10** **Food allergies continue to rise** and are a safety and public health concern across the United States. You can get free resources and find out how to help keep those with food allergies safe at:

[www.FoodAllergyAwareness.org](http://www.FoodAllergyAwareness.org)

# SafeFARE: Chef Card Template

**How to use your chef card:** In addition to asking a lot of questions about the ingredients and preparation methods, carry a "chef card" that outlines the foods you must avoid. Present the card to the chef or manager for review.

Fold your card in half, then tape it together and store in your wallet. You can even laminate it to make it more durable. Be sure to make several copies in case you forget to retrieve it from the restaurant or to store in multiple locations.

*This is an interactive PDF that will allow you to type your allergens directly onto the chef card.*

## How to give EpiPen® or EpiPen® Jr

**1.** Form fist around EpiPen® and **PULL OFF** grey cap.

**2.** Place black end against outer mid-thigh (with or without clothing).

**3.** Push down **HARD** until a click is heard or felt and hold in place for 10 seconds.

**4.** Remove EpiPen® and be careful not to touch the needle. Massage the injection site for 10 seconds.

## MILD TO MODERATE ALLERGIC REACTION

- swelling of lips, face, eyes
- hives or welts
- tingling mouth, abdominal pain, vomiting

## ACTION

- stay with person and call for help
- give medications (if prescribed) .....
- locate EpiPen® or EpiPen® Jr
- contact family/carer

**Watch for any one of the following signs of Anaphylaxis**

## ANAPHYLAXIS (SEVERE ALLERGIC REACTION)

- difficult/noisy breathing
- swelling of tongue
- swelling/tightness in throat
- difficulty talking and/or hoarse voice
- wheeze or persistent cough
- loss of consciousness and/or collapse
- pale and floppy (young children)

## ACTION

- 1 Give EpiPen® or EpiPen® Jr**
- 2 Call ambulance\*- telephone 000 (Aus) or 111 (NZ)**
- 3 Lay person flat and elevate legs. If breathing is difficult, allow to sit but do not stand**
- 4 Contact family/carer**
- 5 Further EpiPen® doses may be given if no response after 5 minutes**

## If in doubt, give EpiPen® or EpiPen® Jr

EpiPen® Jr is generally prescribed for children aged 1-5 years.

\*Medical observation in hospital for at least 4 hours is recommended after anaphylaxis.

## For School Nurses

Home > For Healthcare Partners > For School Nurses

### Epinephrine in schools

Approximately 1 in 13 children are affected by food allergies<sup>1</sup>— and children at risk for anaphylaxis may be present in almost every classroom.<sup>1,2</sup> An estimated 13% to 23% of children with food allergies experience reactions at school.<sup>3</sup>

As a school nurse, you know that readily accessible epinephrine auto-injectors are integral to the emergency treatment of children with food allergies.<sup>4</sup> Epinephrine is the only first-line therapy for anaphylaxis, according to The National Institute of Allergy and Infectious Diseases guidelines.<sup>5</sup> But not all children at risk for anaphylaxis have received an epinephrine prescription or always carry their auto-injectors with them.<sup>6,7</sup>

That's where the **EpiPen4Schools<sup>®</sup>** program can help. EpiPen4Schools<sup>®</sup> is offered by Viatrix Inc., the marketer and distributor of EpiPen<sup>®</sup> (epinephrine injection, USP) and EpiPen Jr<sup>®</sup> (epinephrine injection, USP) Auto-Injectors, to help improve access to epinephrine in the school setting.

### How EpiPen4Schools<sup>®</sup> works

The EpiPen4Schools<sup>®</sup> program provides up to four free EpiPen<sup>®</sup> (epinephrine injection, USP) or EpiPen Jr<sup>®</sup> (epinephrine injection, USP) Auto-Injectors in the form of two EpiPen 2-Pak<sup>®</sup> cartons, two EpiPen Jr 2-Pak<sup>®</sup> cartons or one 2-Pak of each kind along with EpiPen<sup>®</sup> Trainers and a detailed training video, to qualifying public and private kindergarten, elementary, middle and high schools in the US. Schools may receive the authorized generic versions of EpiPen and EpiPen Jr.

To participate in EpiPen4Schools<sup>®</sup>, a school nurse or other authorized school representative must visit [www.EpiPen4Schools.com](http://www.EpiPen4Schools.com) to download the order and certification form, and then fax or email the form with a valid prescription to [1-973-718-4328](tel:1-973-718-4328) or [info@bioridgepharma.com](mailto:info@bioridgepharma.com). Alternatively, school representatives can call [1-973-845-7600](tel:1-973-845-7600) to speak with a live representative. There is no requirement for a school to purchase additional EpiPen<sup>®</sup> Auto-Injectors or any other Viatrix Inc. product.
