American Academy of Surgical Physician Assistants – Editorial Review Board

Special thanks to Tom Gocke, PA-C and OES for this presentation.

Learning Objectives

At the end of this lecture attendees will be able to:

- Describe fractures based on location, angulation, displacement & soft tissue injuries
- Recognize and describe factors associated with acute fractures
- Describe exam maneuvers essential for acute fractures
- Describe essential immobilization techniques for acute fractures
- Recognize and describe differences in fractures that require emergent treatment vs those that can be sent home and follow up in the office
- Recognize and treat Fractures of the Upper Extremity (UE)
- Recognize and Treat Fractures of the Lower Extremity (LE)

Goals of Fracture Treatment

- Restore the patient to optimal functional state
- Prevent fracture and soft-tissue complications
- Get the fracture to heal, and in position which will produce optimal functional recovery
- Rehabilitate the patient as early as possible

Fracture Description

Fracture Description

- Fx location, anatomical site (bone and location on bone)
- Configuration Displacement
 - three planes of angulation
 - translation
 - shortening
- Articular involvement/epiphyseal injuries
 - fracture involving joint
 - dislocation
 - ligamentous avulsion
- Open v. Closed:
 - Gustilio-Anderson classification
- Neurovascular status

Fracture Pain

Fracture Pain

There currently is a lack of effective treatment options for fracture pain that reliably relieve pain without potentially interfering with bone healing.

Current treatment options for management of fracture pain are insufficient.

Current recommendations conclude that NSAID use is warranted in fracture healing, as benefits outweigh the risk.

- The use of NSAIDs should be done at the lowest dose and may help to avoid use of narcotics
- There is a celling effect with Ibuprofen at 600mg, there is no difference between 600mg and 800mg regarding increased analgesic or anti-inflammatory effect.
- There is also good literature showing 600mg of Ibuprofen with 1000mg produces better analgesic effect at 2 hours then narcotic medication.

Mechanism of Injury

Mechanism of Injury

Traumatic, pathological, stress, low energy, high energy, etc.

- Trauma starts with the transfer of energy to the body from an outside force. You must spend time to have the patient describe the specific MOI
 - This should match up with the patient symptoms and area of pain
 - If low energy or no injury acute fracture is unlikely

Palpation

Palpation

Palpation is the process of using one's hands or fingers to physically examine part of the body by feel.

Fractures do no have referred pain, there is typically palpable tenderness over the area of the fracture.

- Always palpate joint above and joint below to now miss anything.
- Start with palpation away from the area of pain, then palpate are of pain last
- Re-examine X-rays after palpation to look for subtle fracture findings
- If patient has change on x-ray with no palpable tenderness over this area, unlikely this is acute fracture

Soft Tissue Injury

Soft Tissue Injury

Skin

• Open fractures, degolving injuries and ischemic necrosis

Muscles

Crush and compartment syndrome

Blood Vessels

Vasospasm and arterial laceration

Nerves

Neurapraxias, axonotmesis, neurotmesis

Ligaments

Joint instability and dislocation

IMMOBILIZATION

IMMOBILIZATION

Importance of Immobilization

- Reduce Blood Loss
 - Femur Fx up to 1500 ml blood loss
 - Tibial Fx up to 1000ml blood loss
- Pain reduction
- Reduce damage to soft tissues
- Reduce or minimize compartment syndrome
- Reduce spread if infection
 - Reduce Fx to minimize tissue injury

IMMOBILIZATION

Fracture Blisters

- Occur 2nd to higher energy fx
- Skin adheres to bone and little subQ fat
- Resembles 2º burn (clear v. bloody)
- Develop 6-48 hrs
- Staph/Strep colonization
- Impacts treatment options
- · No consensus on Treatment
 - Dry dressing-Xeroform-Silvadene
- Delays Surgery average 7 days
- Infection complication

Healing

Healing

When is the Fracture healed?

	Upper Limb	Lower Limb
Adult	6-8	12-16
	weeks	weeks
Child	3-4	6-8
	weeks	weeks

Radiologically

- Bridging callus formation
- Remodeling

Biomechanically

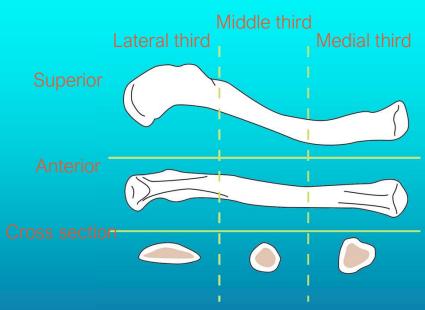

Upper Extremity Fractures

Clavicle Fx

Clavicle Fracture

Bone -

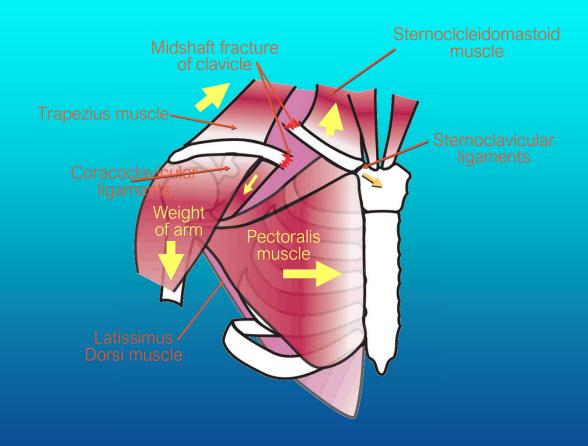

- Triangular shaped- medial 1/3
 - Tubular shaped- middle 1/3
 Flat shaped lateral 1/3
- Most fractures occur junction of middle and distal 1/3 clavicle
 - Occurs due to change in geometry of bone
 - Thinnest part of bone

Craig EV: Fractures of the shoulder: Part II. Fractures of the Clavicle, in Rockwood CA, Green DP, Bucholz RW, Rockwood and Green's Fractures in Adults, ed 3. Philadelphia, PA: JB Lippincott, 1991, vol 1 pp 928-990

 No muscle and ligament coverage in this area © 2022 ORTHOPAEDIC EDUCATIONAL SEF

Midshaft Clavicle Fracture

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Mid-shaft clavicle Fracture

Factors in surgical management

- Open or closed fracture
- Pain
- Displaced fractures (>1.5 cm)/comminuted fx
- Shoulder girdle shortening (>2 cm)
- Skin impairment
- Neuro or vascular injury
- · Loss Abduction strength
- Greater cosmetic deformity/failed conservative management
- Greater demand for overhead activity

Mid-shaft Clavicle Fracture

Treatment Options:

- · Indications Non-op care
 - Minimally displaced, < 1.5cm shortening, medically unfit for surgery
- Non-surgical management
 - · Sling vs. Figure 8
 - Compliance issues
 - · Less discomfort with sling
 - Pain medication
 - Activity Limitations
 - F/U 1-2 weeks

Honeycutt MW, Fisher M, Riehl JT, Orthopaedic Tips: A Comprehensive Review of Midshaft Clavicle Fractures, JBJS JOPA 2019;7(3):e0053

Andersen et al: Treatment of Clavicle Fractures: Figure 8 vs. Simple Sling. Acta Orthop Scand 1987;58:71-74

Humerus Fx

Proximal Humerus Fractures

Epidemiology

- · Common fx in older adults >65 yr. old
- · 2-part fx most common (Surgical neck & Greater Tubercle)
- Blood supply key to overall healing process
- High-rate osteonecrosis w/ 4-part Fx
- Female > male

Factors contributing to Proximal Humerus fractures:

- Age/sex
- · Bone quality osteoporosis
- · Fracture displacement
- Diabetes

Attum B, Thompson JH. Humerus Fractures Overview. [Updated 2020 Aug 10]. In: StatPearls [Internet]. Treasure Island (FL): StatPearls Publishing; 2020 Jan., Available from: https://www.ncbi.nlm.nh.gov/pecks/NBK482281/

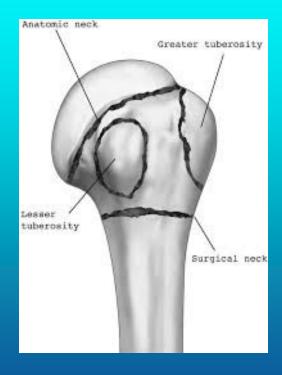

Pencle FJ, Varacallo M. Proximal Humerus Fracture. [Updated 2020 Aug 16]. In: StatPearls [Internet]. Treasure Island (FL): StatPearls Publishing; 2020 Jan Available from: https://www.ncbi.nlm.nih.gov/books/NBK470346

Proximal Humerus Fractures

Neer Classification

Anatomic Segments

- Shaft-Articular Head-Greater Tubercle-Lesser Tubercle
- Parts considered: >1 cm displaced, 45 degrees angulation
 - 2-part
 - Articular component- Fx line thru anatomic neck
 - Shaft Component Fx line thru surgical neck most common
 - 3-Part
 - · Articular surface, thru anatomic neck, Humeral shaft & greater tubercle
 - Articular surface, thru anatomic neck, Humeral shaft & lesser tubercle
 - 4-Part
 - Variation anatomic/surgical neck, great/lesser tubercle
 - Fracture / Dislocation

Triplet J, Proximal Humerus Fractures, Orthobullet.com, updated 7/19/2020 https://doi.org/10/2020/10/2

Proximal Humerus fx

Proximal Humerus Fracture

Emergent Treatment

- Majority treatment "hanging sling"
- Pain management
- Sleeping postures
- Early motion-elbow/Shoulder

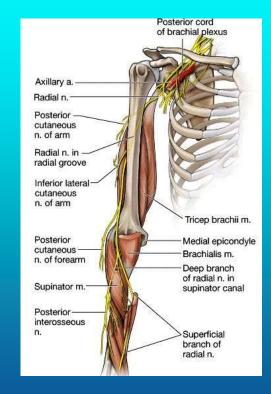

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Humeral Shaft Fracture

- Epidemiology
 - Usual treatment is non-operative
 - High Energy mechanism
 - Low Energy: high suspicion for pathology fx
 - Primary Mechanism of injury
 - Direct blow transverse or comminuted fracture
 - MVA
 - Indirect blow spiral or oblique fracture
 - Fall elderly more common
 - Throwing motion– less common
 - Concern for Radial Nerve injury

Bounds EJ, Frane N, Kok SJ. Humeral Shaft Fractures. [Updated 2020 Aug 24]. In: StatPearls [Internet]. Treasure Island (FL): StatPearls Publishing; 2020 Jan-. Available from:

Humeral Shaft Fracture

Humerus Fx

Proximal Humerus

- · Treatment considerations-
 - Multifactorial
 - Age
 - Fracture type
 - Pt expectations
- Treatment options
 - Non-op
 - ORIF
 - Hemiarthroplasty
 - Reverse TSA

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Humeral Shaft Fracture

Treatment options- Closed Fracture

- Frequent follow up and adjustment of hanging arm cast/brace/splint
- Xray weekly x 3 weeks
- Begin early wrist/hand ROM
- · Acceptable post reduction alignment
 - <20° anterior angulation
 - <30° varus
 - <15° malrotation</p>
 - · 3cm shortening

Surgical indications

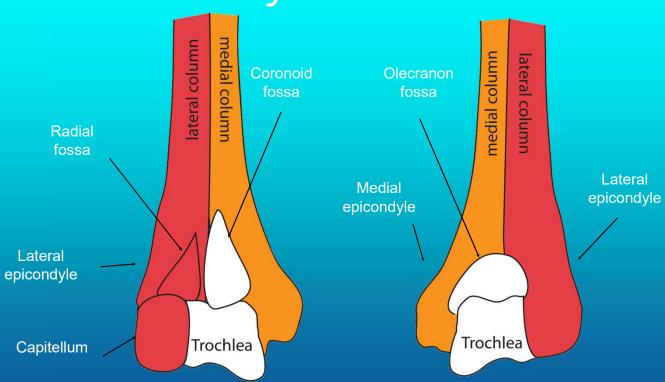

- Open Fx\Polytrauma
- Vascular injury
- Floating Elbow
- · Obesity immobilization difficulty

Supracondylar Humerus FX

Bony Landmarks

Supracondylar Humerus Fx

Epidemiology

- 30% all Elbow fx
 - Supracondylar
 - · Single Column fx- Lateral
 - · Bi-column fx- heavy damage
 - Young men & older female
 - Falls from standing height/high energy
- Assoc Injuries
 - Elbow dislocation
 - Terrible Triad
 - Floating Elbow
 - · Volkmann Contracture missed forearm compartment syndrome

Supracondylar Humerus Fx

Exam

- Neurovascular- assess frequently
 - High suspicion for vascular injury
- Grossly unstable fx limit motion

Acute treatment

- · Compromised Neurovascular
 - · Emergent vascular consult/CTA
 - Concern for forearm compartment syndrome
 - Admit
- · Long-arm posterior splint vs Dbl Sugar-tong
 - <90° flexion
- Sling
- · Pain management
- Follow up 3-5 days
- · Most all elbow Fx require surgery

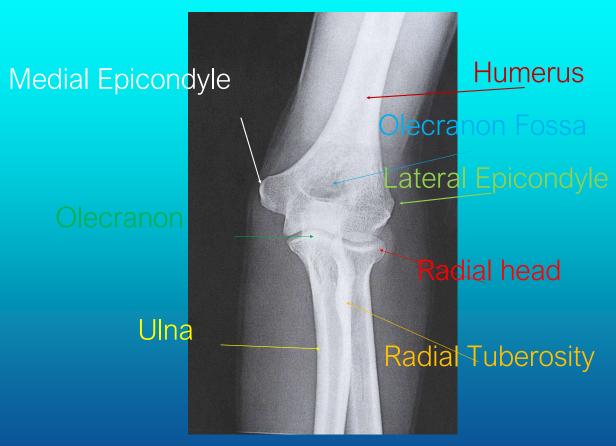

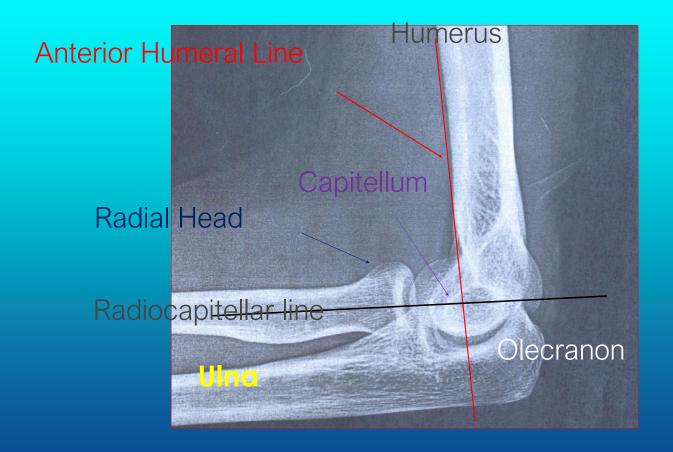

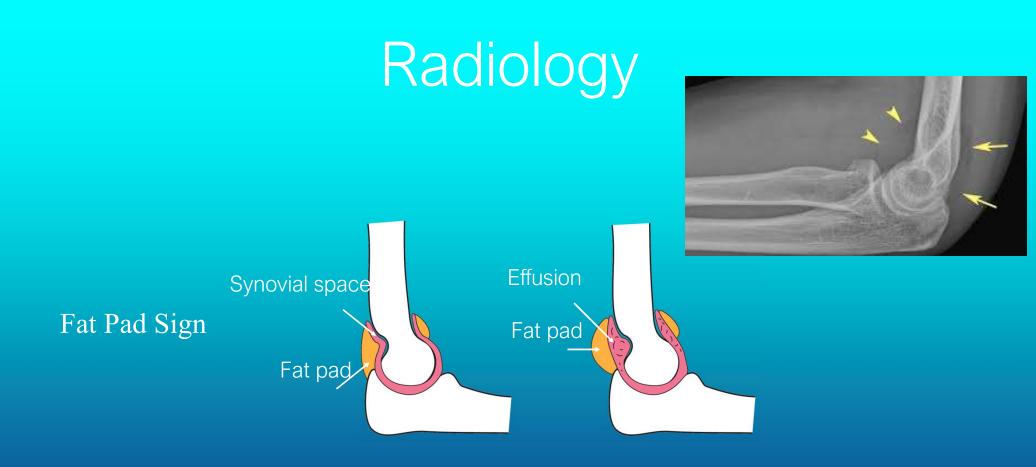

Elbow Fx

--Radial head --Olecranon

Elbow Anatomy

Radial Head Fx

Radial Head Fx

Epidemiology

- Most common elbow fx
- · Injury mechanism- FOOSH, elbow extended & forearm pronated
- 35% assoc. injuries
 - LCL sprain (80%)
 - Essex-Lopresti injury
 - Fx Coronoid/Olecranon- ELBOW DISLOCATION

Exam

- Swollen & tender lateral elbow
- Pain with Pronation/Supination

Radial Head Fx

Radiographs

- AP, lateral & radial head view
 - Radial head view: oblique lateral
 - Helps see subtle fx radial head
 - Check for Fat Pad signs
 - Fx Tolerances: Rule of 3's (Radin & Riseborough, JBJS-A, 1966)
 - 1/3 radial head fx
 - 3mm displacement/diastasis
 - >30 degrees angulation
- CT Scan
 - Needed with comminuted fx radial head
 - Helps with surgical preplanning

Radial Head Fracture

Treatment

- Sling vs Sugar-tong splint
 - · Sling low demand patient/ elderly
 - · Sugar-ting High demand
 - · Athletes, laborers, non-compliant, failed sling
 - Sugar-tong gets a sling
 - Pain management
 - Limit Activity
 - Follow up 1 week
 - May begin ROM exercises
 - · Will need serial x-rays till healed

· All displaced comminuted Fx will require surgical stabilization or Radial head replacement

- - · Young- High energy
 - · Elderly fall standing height
- Injury mechanism-Direct blow leads to comminuted fxFOOSHE Transverse fx
- 35% assoc. injuries
 LCL sprain (80%)
 Essex-Lopresti injury
 Fx Coronoid/Olecranon

Exam

- Swollen & tender lateral elbow
- Pain with Pronation/Supination

Radiographs

- AP, & Lateral Elbow
- Fracture pattern
 - Avulsion
 - Transverse
 - Oblique
- CT Scan
- Exam
 - Limited Elbow Flex\Ext ROM
 - Palpable defect olecranon
 - Skin lesion

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Treatment

- Most Olecranon fx will need surgical stabilization
 - · Stabilization allows for earlier ROM
- Immobilize in Long-arm posterior splint
 - Elbow flexed to 45-90º
- Sling
- Pain management
- Follow up 1 week

Forearm Fx

Forearm Fractures

Etiology

- Injury Mechanism:
 - Direct blow- High energy vs. ground fall
 - FOOSH w/ pronated hand/forearm =- axial load
 - Car accident
 - Gunshot wounds/Farm-Industrial
 - Significant soft-tissue injury
 - Open Fx with nerve vascular injury
 - · Refer to Gustilo classification (classification of open fractures)
- Delays in surgery lead to increased risk of proximal radioulnar synostosis

Symptoms

- gross deformity, pain, swelling
- loss of forearm and hand function
- Physical exam
 - Check forearm compartments
 - High suspicion compartment syndrome
 - · Pain with passive stretch of digits
 - Pain out of proportion
 - Assess radial and ulnar pulses
 - · Check Median, Radial, and Ulnar nerve function
- Neurovascular
 - Median nerve: finger flex/Make a fist
 - AIN- "OK" sign (Flexor Pollicis Longus)
 - Radial nerve: Wrist/Finger extension
 - PIN: "Thumbs up" sign (Extensor Pollicis Longus)
 - Ulnar Nerve: Finger ABD/ADD
- Assess elbow & wrist for associated injury

Forearm Fractures

Radiographic Exam

- AP/Lateral/Oblique views
 - AP & lateral:
 - Forearm to include wrist and elbow
 - radial head will bisect Capitellum
 - good radiocapitellar apposition on alignment
- Look at alignment of distal ulna lateral
- Ulna should bisect base of 4th and 5th metacarpal
- Radius & ulna should be aligned same plane

Photo courtesy TGocke, PA-C

Radius & Ulna Shaft Fx

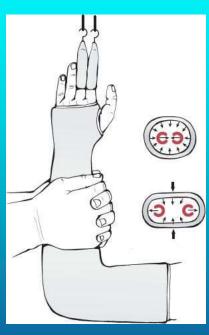

Treatment

- Nonoperative ADULTS
 - Isolated, nondisplaced fractures
 - Nightstick fx isolated distal 2/3 ulna shaft fx
 - < 50% displacement and
 - < 10° of angulation
 - High union rates
 - Sugar-tong cast or functional fx brace
 - · Interosseous mold: hand supinated, and forearm flattened

Treatment – **ADULTS**

- Sugar-tong splint & Sling
- Pain management
- Follow up 1 week
- Operative Open Reduction Internal Fixation (ORIF)
 - · Displaced distal ulna & Proximal ulna fxs
 - ALL radial shaft fxs
 - ALL both bone fxs
 - ALL open fractures
 - Segmental bone loss
 - Comminuted fx >1/3 length of shaft
 - Forearm nonunion
 - Most important structure to restore: radial bow
 - External Fixation temporary/open wounds

Pediatric Fx

- More growth & remodeling potential the better the outcome
- · Most will be reduced with good alignment
- Reduction undersedation and bedside Fluoro or Anesthesia with Fluoro
- · Long arm cast vs sugar-tong with a wrap over
- Serial follow- ups & x-rays
- Surgery
 - Open fx
 - Neurovascular compromise

Monteggia Fx & Gaeleazzi Fx

Monteggia & Galeazzi Fx – MU-GR

Monteggia FX

MU-Gr

- Ulna Fx with Radial head injury
 - Radial head FX
 - Radial head Dislocation

Galeazzi Fx

Mu-GR

- Radius Fx
- DRUJ instability/Injury

Galeazzi Fractures

- Galeazzi Ex
 - Defined as: Fracture mid to distal 1/3 radius shaft with dislocation at Distal Radioulnar Joint (DRUJ)
 - Dorsal dislocation of distal ulna most common DRUJ disruption
 - Avulsion fx at ulnar styloid is tip to be suspicious for DRUJ injury
 - Higher risk: sports, osteoporosis, post-menopausal
 - 40% complication rate, 2-10% mal/non-union rate
 - 1 in 4 Radial shaft fx is a true Galeazzi fx.
 - Falls
 - FOOSH wt on the pronated hand at time of injury causes sublux DRUJ & dorsal angulation of radial fx
 - Location of radial fx in proximity to DRUJ has some bearing on potential for DRUJ instability
 - More distal fracture = higher risk of instability

GALEAZZI FRACTURES

Dorsal displacement - ulna

- Galeazzi Fracture
 - Radius fracture and DRUJ injury
 - Ulnar styloid fx
 - widening of DRUJ on AP view
 - dorsal or volar displacement ulna
 - Best seen lateral view
 - radial shortening (≥5mm)

Monteggia Fracture

Monteggia Fracture

Defined as: Proximal 1/3 ulnar fracture with associated radial head dislocation

Etiology

- More common in children peak incidence 4-10yo
- Rare in adults
- Delayed diagnosis >2-3 weeks = increased risk complication

Injury Mechanism

- · Fall with blow to forearm, Elbow /forearm Hyperpronated
- · Energy transmitted thru Interosseous ligament
- · Causes rupture of proximal Quadratus & Annular Ligament

Monteggia Fracture

Radial Head dislocation

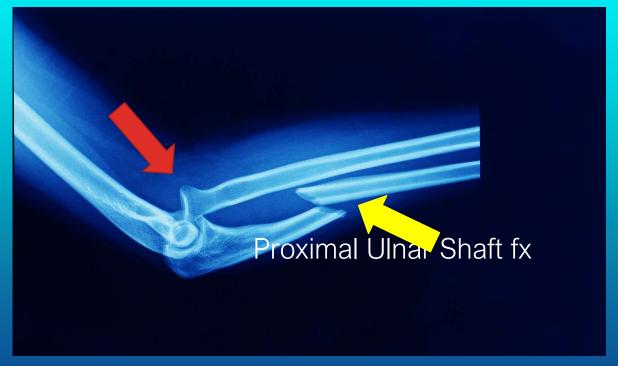

Photo courtesy TGocke, PA-C

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Monteggia Fractures

Treatment

- Closed reduction temporary solution
 - Relax tension on soft-tissues.
 - Radial head may not reduce 2nd to Annular ligament entrapment
 - Splint/Cast: long arm
 - Forearm neutral to supinated position
 - Elbow flexed to 100 degrees to relax biceps pull
- Surgical correction is primary means of treatment
 - Unstable fracture
 - · Plate fixation Ulna & reduce Radial head
 - · Long-arm splint, hand supinated
 - Concern for post-op elbow stiffness

Distal Radius Fx

Distal radius fractures

Epidemiology

- Distal Radius (DR) [& Ulna] fx account for 25% all UE fx
- Bimodal distribution: younger males and older females
 - Kids<18: Peak 12-14 yrs boys, 10-12 old girls
 - · Decreased level skeletal mineralization & density w/ puberty
 - Adults > 50: Peak Caucasians > 65 yrs old
 - · Osteoporosis common risk factor
 - Prior fx > age 50
 - Steroid use
 - >75 yrs old w/ dementia
 - Intra-articular fx more common in females w/ DM
- · Contributing Factors: Obesity, osteoporosis, DM, Tobacco use

Meaike JJ, Kakar S, management of Comminuted Distal Radius Fractures: A Critical Review, JBJS Reviews 2020;8(8)e20.00010

Porrino JA, Maloney E, Scherer K, et al. Flacture of the Distal Radius. Epidemiology and Premanagement Radiographic Characterization, American Journal of Roentgenology 2014 203:3, 551-559

Corsino CB, Reeves RA, Sieg RN, Distal Radius Fractures, StatPearls, Treasure Island, FL, StatPearls Publishing Jan 2020

Distal Radius Fracture

Radiographs

- Radial Height
 - Measured from Posterior-Anterior (PA) projection
 - 2 lines perpendicular to long axis Radius
 - · Parallel to Radial Styloid
 - Parallel to Ulnar articular surface
 - Normal 12 mm approximate (ulnar negative)
 - Excessive Radial shortening? Assoc. tear of TFCC

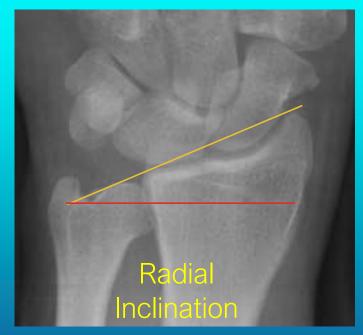

Porrino JA, Maloney E, Scherer K, et al <u>Fracture of the Distal Radius: Epidemiology and Premanagement Radiographic Characterization</u>, American Journal of Roentgenology 2014 203:3, 551-559

Picture courtesy T Gocke, PA-C

Distal Radius Fracture

Radiographs

- Radial Inclination
 - Defined as: angle between a line perpendicular to the Radial central axis and a line drawn along the Radial articular surface
 - Articular surface Radius 23º normal Radial inclination
 - Normal range: 13-30°
 - Loss of Radial Inclination reflects fracture v. malunion

Porrino JA, Maloney E, Scherer K, et al <u>Fracture of the Distal Radius: Epidemiology and Premanagement Radiographic Characterization</u>, American Journal of Roentgenology 2014 203:3, 551-559

Distal Radius Fracture

Radiographs

- Volar/Palmar Tilt
 - Defined as —angle between a line perpendicular to the central Radial axis and a line connecting the dorsal and volar margins of the articular surface of the distal [as seen on lateral projection]
 - Loss of volar tilt is seen with acute distal Radius fx or malunion
 - Normal 10 °

Porrino JA, Maloney E, Scherer K, et al <u>Fracture of the Distal Radius: Epidemiology and Premanagement Radiographic Characterization</u>, American Journal of Roentgenology 2014 203:3, 551-559

Colles' Fractures

Defined as: distal radius fx, dorsal comminution-angulation-displacement, radial shortening & Ulnar styloid fx

- Metaphyseal fx 1.5cm proximal to Carpal articulation
- Typically non-articular w/ dorsal displacement
 - More severe fx considered with intra-articular comminuted appearance (dorsal)
- · Dorsal displacement/angulation principle distal fx fragment
- Young- time of puberty 2nd to lower bone mineralization
 - Higher energy –sports
 - Elderly- Women > men
 - Falls
 - Osteoporosis

Summers K, Fowles SM. Colles' Fracture. 2020 Aug 10. In: StatPearls Treasure Island (FL): StatPearls Publishing; 2020 Jan

HEMATOMA BLOCK

- Inject Hematoma from dorsal aspect of wrist
 - 5ml 1% Lidocaine & 5ml 0.5% Bupivacaine
 - 10ml 1% Lidocaine
 - Sterile prep & technique
- Occ. need few ml's around ulnar styloid too
- No monitoring required
- Risks:
 - Infection & LA toxicity

• Do not use once > 24hrs old as hematoma organized

Colles' Fracture

Treatment

- Non-op
 - Majority of Colles- type distal radius fx do not need surgical intervention
 - Displaced, extra-articular, non-comminuted fx are the best with Closed reduction.
 - Reduction maneuver
 - · Traction of the hand
 - Counter-traction @ the elbow
 - Re-produce deforming force "unlock" the fracture
 - · Volar-medial force applied to distal Radius fragment
 - Pronated position overcomes deforming supination force
 - · Immobilize in sugar-tong splint
 - Post-reduction x-ray
 - Post-reduction exam: neurovascular intact
 - · Follow up in 1 week for re-imaging

Meaike JJ, Kakar S, Management of Comminuted Distal Radius Fractures: A Critical Review, JBJS Reviews 2020;8(8)e20.00010

Distal Radius Fractures

Smith's Fracture

- Epidemiology
 - Extra-articular distal Radius w/ volar displacement
 - Intra-articular Smith's III = Volar Barton
 - Hand /wrist follows Radius fragment
 - 5% all distal Radius fractures
 - Garden Spade deformity
 - Fall backward on of palmar flexed wrist or direct blow dorsal wrist
 - · Volar displacement also seen fall on palmar hand
 - Highest incident young males/older females
 - High energy falls young
 - Osteoporotic bone elderly

Picture courtesy T Gocke, PA-0

Schroeder JD, Varacallo M. Smith's Fracture Review. [Updated 2020 Aug 15]. In: StatPearls [Internet]. Treasure Island (FL): StatPearls Publishing; 2020 Jan-.

Distal Radius Fractures

Die-Punch Fracture

- Defined as
 - Intra-articular distal Radius fx w/ depression into Lunate foss;
- Injury Mechanism
 - Axial load distal Radius
- Radiology
 - Traditional X-ray views
 - CT scan for comminuted fx with > 2mm displacement
- Treatment
 - Surgical intervention, no non-op options
 - Elevation of articular surface w/ stabilization distal radius fx.

Ahn L, Vitale M, Franko O, Distal Radius Fractures, Orthobullets, updated 1/9/2021, retrieved 2/16/2021

Carpal Fx

Carpal Bone Injuries

Scaphoid Fx – navicular

- Epidemiology
 - Most frequently fractured carpal bone
 - Approximately 15% of all acute wrist injuries
 - Transverse fx pattern considered more stable & best healing prognosis
 - Mechanism of Injury:
 - Fall on outstretched hand (FOOSH)
 - Axial load to wrist/carpal bones
 - Some radial deviation & Hyperpronation

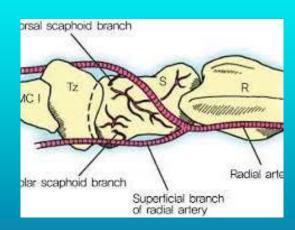

Scaphoid Fracture

3 parts: proximal & distal poles, waist

- Most fx occur @ waist 70% all Scaphoid fx.
- Proximal pole poor healing prognosis 2nd blood supply (highest rate AVN) [20%]
- Distal pole most common fx location in kids (ossification center) [10%]

Physical Exam

- Anatomic snuffbox tenderness
 - Volar wrist pain navicular tuberosity
 - Axial loading of the thumb most sensitive & most specific [Gillion 2021]

Carpal Bone Injuries

Scaphoid Fx- Radiographs [Gillion 2021]

- Wrist x-rays: PA/PA grip, Lateral & Oblique,
 - · Suspect scaphoid fx, snuffbox pain, FOOSH
 - scaphoid view: 30-degree wrist extension, 20-degree ulnar deviation
 - negative x-ray & high suspicion for fx: repeat x-ray 14-21 days
 - Osteolysis 2nd to bone healing should be present in 1-3 weeks
 - Immobilize in Thumb Spica splint/cast until follow up xray

Picture courtesy TGocke, PA-C

Carpal Bone Fractures

Scaphoid Fx

Treatment:

- Important Initial treatment:
 - Suspect occult scaphoid fx
 - Initial recognition of potential injury mechanism
 - Thorough physical examination
 - Comprehensive review of initial radiographs
 - Thumb spica splint vs. cast
 - Initial immobilization for 14-21 days
 - Repeat x-ray on follow up exam

Photos courtesy TGocke, PA-C

Hand-Metacarpal Fx

Metacarpal Fractures

Anatomy Review

- Index & Long (middle) fingers least mobile
- Ring & Small fingers more mobile & articulate with Hamate
- Thumb most mobile 2nd to articulation with carpus
- Palmar & Dorsal Interossi muscles originate for MC shafts
- Intrinsic Muscles
- Extrinsic Muscles

Metacarpal Fractures

Epidemiology

- Most fractures of the hand are to the metacarpal (MC)
 - Metacarpal neck most common injured & 5th metacarpal most often injured
 - 30% of all hand Fx are to the Shaft
- Men highest incidence of metacarpal injuries
- Average age injury 10-30 yrs.
- Fx located by location: Head- Neck Shaft Base
- Treatment metacarpal fx based on finger and fx location
- Consider other injuries
 - Lacerations open fx compartment injuries- Infection

Borchers JR, Best TM, Common Finger Fractures and Dislocations, Am Fam Physician 2012, 85;(8):805-810

Wieschhoff GG, Sheehan SE, Wortman JR, et al, Traumatic Finger Injuries: What the Orthopaedic Surgeon Wants to Know, RNSA 2016;36(4):1106-1128

Metacarpal Fractures

Metacarpal Shaft FX

- Minimal displacement
- NO malrotation
- <5mm shortening
- 10 degrees coronal angulation any MC

Nelson, Wongworawat: Tolerances, 3rd edition 2009

Metacarpal base Fractures

Metacarpal Base fx –

- Extra-articular: Tx like MC Shaft
- Intra-articular: Tx based on malalignment
 - · Malalignment Leads premature OA, weak grip & poor ROM
 - More Ulnar MC's allow for more ROM @ CMC jts. Leading to more noticeable malalignment
- Fxam
 - Assess for Rotational deformities & weakness
 - Review X-ray studies
 - If Intra-articular or appear comminuted with ? Intra-articular extension need CT scan

X-ray Image courtesy Tom Gocke, PA-C Library

Oak N, Lawton JN, Intra-Articular Fractures of the Hand, Hand Clinic, 2013;29:535-549

Metacarpal Base Fracture

- Initial Treatment
 - Recognize injury seen on x-ray
 - Assessment for malrotation deformities & grip strength changes (hand dynamometer)
 - Application Ulnar/Radial gutter splint intrinsic plus position
 - Volar /dorsal blocking splint
 - Consider CT Scan hand
 - Ortho Hand/Plastics Hand follow up within <1 week of CT scan being done
 - Surgery vs. Thermoplastic splint/Cast immobilization
 - Needs close follow up if treated conservatively

Bernstein D, Metacarpal Base Fractures – Surgical vs. Conservative care, November 1, 2019 – Personal conversation

Oak N, Lawton JN, Intra-Articular Fractures of the Hand, Hand Clinic, 2013;29:535-549

Metacarpal Base Fracture

Finger Fx & Dislocations

Phalangeal Fractures

Epidemiology

- Most common fracture to the hand 50%
- Finger phalanx divided into:
 - Proximal (P1) Middle (P2) Distal (P3)
- Common Injury Mechanism: Axial load & Crush injury
- Injury involves Tuft-Shaft-Base
- Fx pattern: Transverse or Longitudinal
- Distal Fingertip anatomy
 - Numerous septa extend from periosteum to skin
 - Overlying nail bed
 - 50% nail Bed extends beyond P3
 - Less likely to dislocate DIP jt. due to fingertip anatomy

Wieschhoff GG, Sheehan SE, Wortman JR, Traumatic Finger Injuries: What the Orthopaedic Surgeon Wants to Know, RNSA 2016;36(4):1106-1128

Phalangeal Fractures

Treatment: Distal phalanx

- Non-operative
 - Extra-articular
 - < 10 degrees angulation
 - <2mm shortening
 - No Rotational deformity
 - Dorsal Finger splint DIP joint vs. Stack Splint
 - Swelling may limit stack splint use initially
 - Monitor for Nail matrix & nail bed laceration

Nelson S, Wongworawat M, <u>Tolerances: an orthopaedic reference manual</u>, 3rd edition, Loma Linda University Press, Loma Linda, CA, 2009

Wieschhoff GG, Sheehan SE, Wortman JR, Traumatic Finger Injuries: What the Orthopaedic Surgeon Wants to Know, RNSA 2016;36(4):1106-1128

Phalanx fx

Shaft Fractures

- Transverse w/o displacement considered to be stable fx can immobilize w/a splint
- Oblique & Spiral: often unstable fx patterns and require surger
- Intra-articular fx: most displaced & require ORIF (same as P2 injury)

Base fractures

• Often need surgery 2nd to poor ability to maintain fx reduction if displaced

Immobilize in extension

Pain meds

F/U 1 week

Phalangeal Joint Injuries

Epidemiology

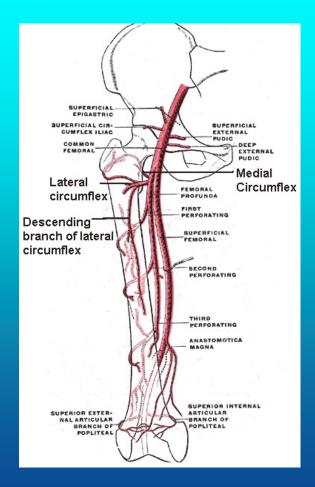

- Occurs men > women, 20's-40's
- Finger dislocations: Common finger injury
- Collateral Ligaments and volar plate ligaments injured
- Forced Hyperextension w/ Axial load

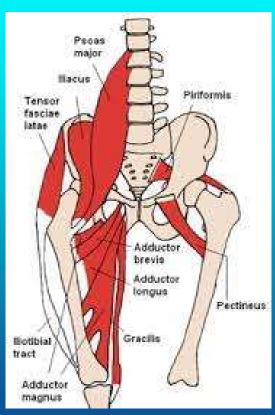

Wieschhoff GG, Sheehan SE, Wortman JR, Traumatic Finger Injuries: What the Orthopaedic Surgeon Wants to Know, RNSA 2016;36(4):1106-1128

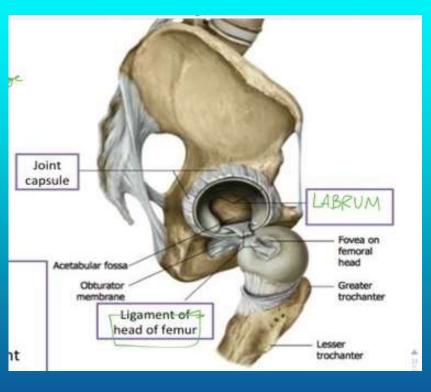

Lower Extremity Fractures

Femur fx
--Hip
--Shaft
--Distal

Hip Anatomy

Subcapital Femoral Neck Fx

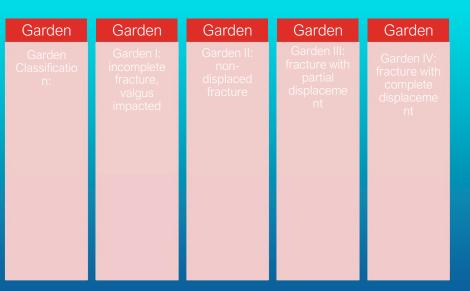

Epidemiology

- Increasingly common with aging population
- Female-white-elderly-osteoporosis
- High energy-young; low energy -elderly
- Neck intracapsular
 - Low blood supply
 - · Poor healing potential
- Mortality
 - 25-30% overall
 - Chronic renal failure 45% 2 yrs
 - Decrease mortality if Surgery < 24 hrs
- Treatment
 - Admit & Medical optimization
 - Surgery <24 hrs
 - Mobilize

Garden Classification

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Basicervical Femoral Neck fx

- 1.8% of proximal Femur fx
- Base of the femoral neck & Trochanteric region
- Same considerations at Subcapital Femoral Neck Fx
- Operative treatment

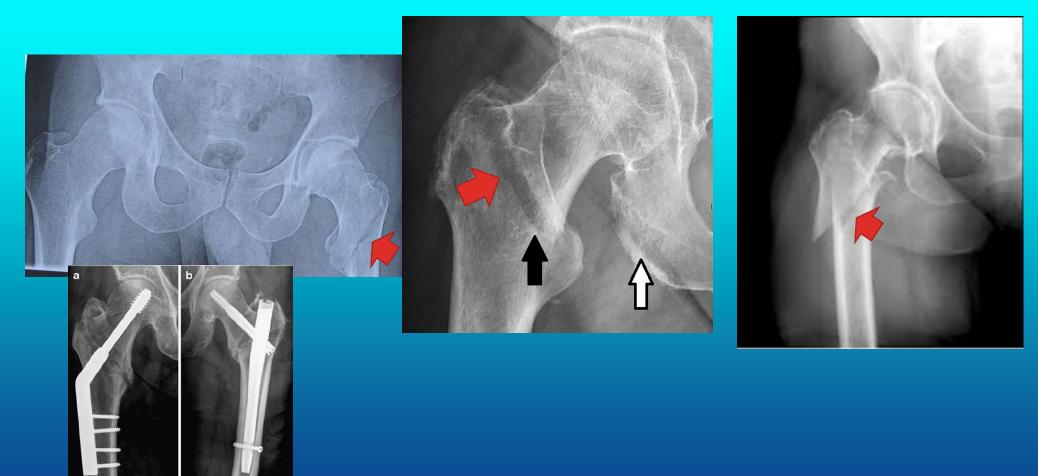

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Intertrochanteric Femur fx

Epidemiology

- Occurs mostly in geriatric populations
- Very similar characteristics as hip fracture
- Occurs same frequency as femoral neck fractures
- Female: Male 2:1
- Mortality & Morbidity rates similar to femoral neck fractures
- Inherently unstable fractures especially if involves posteromedial cortex
- Extracapsular:
 - Between greater and lesser trochanter
 - Area between femoral neck and trochanter

Intertrochanteric Femur Fx

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Sub-Trochanteric Fx

Isolated Lesser Trochanteric Fx

Traumatic Sub Trochanteric fx

- Lesser Troch to 5cm distal
- Trauma/Bisphosphonates
 - Deforming forces
 - Illiopsoas
 - ADDuctors
 - Ext. Rotators
 - X-ray
 - Traction view/pelvis
 - Femur
 - Treatment- Surgery

Femur Shaft fx

Femur Shaft Fractures

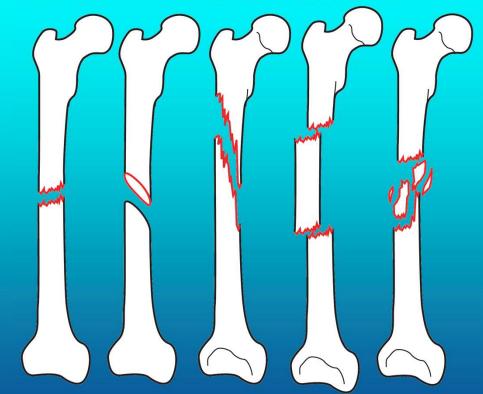

General

- Occurs more in young adults
- High energy
 - MVA/motorcycle
 - · Pedestrian vs. auto
 - Fall
 - Gunshot wound (GSW)
- Stress Fracture
 - Runners or repetitive stress
 - Risk with increasing physical activity
 - Long-term Bisphosphonates use
- Transverse pattern:
 - · Most common femur shaft fracture
- Fracture may involve total hip arthroplasty (THA) components

Femur Shaft Fractures

- Fracture pattern
 - Transverse
 - Oblique
 - Butterfly
 - Segmental
 - Comminuted
 - Location
 - Proximal
 - Middle
 - Distal
 - Supracondylar

Femur Shaft Fractures

- Treatment:
 - Emergent Treatment:
 - Identify life-threatening injuries
 - Good assessment of neuro and vascular status
 - Check for associated fractures/injuries
 - Check for compartment syndrome thigh
 - Immobilize fracture until surgery
 - Immediate OR: long posterior splint (temporary measure) or traction splint
 - Prolonged OR: skeletal traction

Sub-Trochanteric Fx

Bisphosphonate related-Fx

- Treat osteoporosis
- Duration >5 yrs increases risk
- Asian > White
- Shorter, Heavier
- Taking DM meds >1 yr

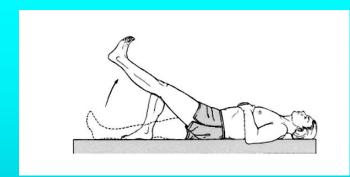

- Direct blow- primary mechanism of injury
 - High energy: dashboard/MVA is most frequent cause (78.3%)¹
- Indirect blow-
 - Forceful knee hyperflexion & eccentric quadriceps contraction
 - Example: Jump/fall with patient landing on their feet combined with an eccentric contraction of the quads³
 - 35% indirect blow fractures do not disrupt extensor mechanism
- Periprosthetic patella fractures after TKA⁴
 - 0.68% in non-resurfaced patella
 - 21% in resurfaced patella

- Visible/ palpable defect between bone fragments
- Hematoma/ hemarthrosis that communicates with joint
- Complete inability to actively extend the knee (likely also correlates with tearing of the medial/ lateral retinaculum)
 - If retinaculum is intact, patient may be able to extend knee with a patella fracture

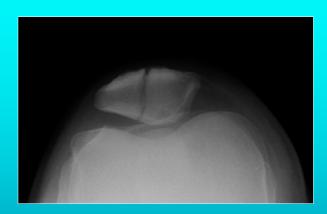

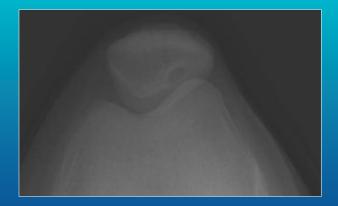

Patella Fractures

- Sleeve fracture
 - Seen only in pediatric age pts.
 - Osteochondral injury where articular cartilage of patella and tendon separate from patellar body
 - Ossification patella begins between age 3-5 yrs
 - Distal pole patella most common location (superior)
 - Commonly seen kids ages 8-15yrs
 - Peak age 12-13 yrs age
 - Boys 3:1 ratio vs. girls

Image courtesy of pediatricimaging.wikispaces.com

Patella Fractures

- Bipartite patella
 - Asymptomatic congenital anomaly
 - 8% population
 - 50% bilateral
 - · Failure of ossification center to close
 - Often confused with patella fracture
 - Most common in the Superolateral patella
 - No treatment required asymptomatic knee

Patella Fx

Tibia fx

Tibial Plateau Fractures

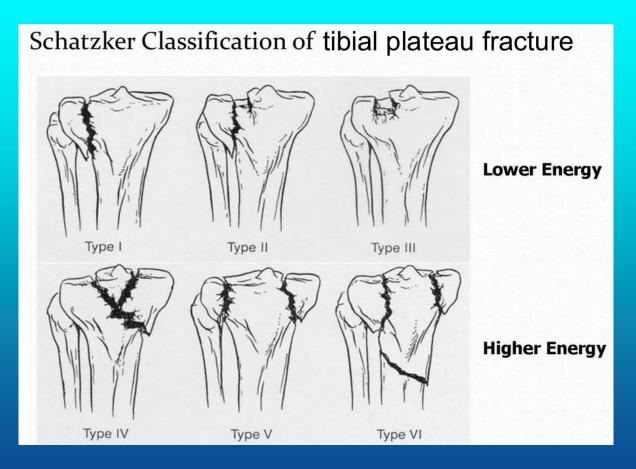

- Compartment syndrome major concern
- Common Fracture patterns
 - Younger age splitting high energy
 - · Older age depression (impaction) osteoporosis
- Women > Men 2nd to osteoporosis
- Injuries to cruciate and collateral ligaments of the knee
- Skin problems common 2nd to thin coverage at proximal tibia
- Neurovascular injuries
- Surgical Treatment
 - Delayed Ex-Fix
 - Definitive- ORIF

Tibial Plateau Fx

Tibial Plateau Fx

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RI

Tibial Plateau Fx

Treatment

- High energy Tibial Plateau fx Need Ex-Fix.
 - · Restore length and protects tissue
- Admit & Compartment checks
- Think about knee dislocation
- Vascular Assessment
 - Ankle Brachial Index (ABI)

Systolic BP LE

Systolic BP UE

• < 0.9 need CTA

- Delay Definitive fixation 5-10 days
 - Skin

Tibia Shaft Fractures

Tibial Shaft FX

- Open fractures of the tibia are more common
- M>F
- 25% all Tibia shaft fractures associated with knee ligament injuries*
- Fracture of the ipsilateral fibula common
- Peroneal nerve injuries commonly assoc. W/ Tibial shaft fx
- High energy young
 - Direct blow
 - · Wedge/comminuted same level Fibula fx
 - Severe soft tissue injuries

- Low Energy- elderly
 - Torsional
- Spiral fx Tibia w/different level Fibular fx
- Post. Malleolar fx ankle assoc. w/ spiral Tibia fx
 - Assoc. Injuries
 - Compartment Syndrome
 - Ipsilateral FX
 - Plafond
 - Plateau
 - Femur
- Posterior Malleolus fx (distal 1/3 shaft/spiral)

Tibia Shaft fx

Tibia Shaft Fx

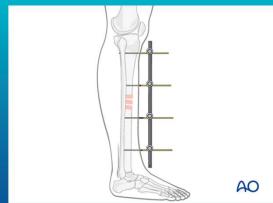

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

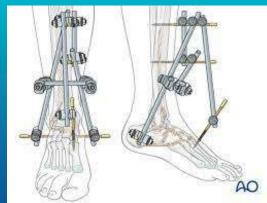

Tibia Shaft Fx

Immobilization

- "Water Ski" position
 - Low Leg & Sugar-tong
 - Mid-shaft/Distal
 - Long leg
 - Proximal
- Compartment checks
- Soft-tissue injury
- Neurovascular checks
- Admit/Observation
- Open Fx/High Energy
 - OR for Irrigation
 - Ex Fix
 - Protect skin

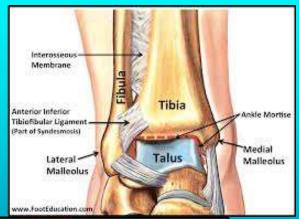

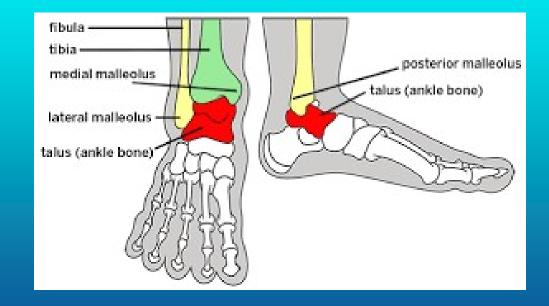

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Ankle fx

Ankle Anatomy

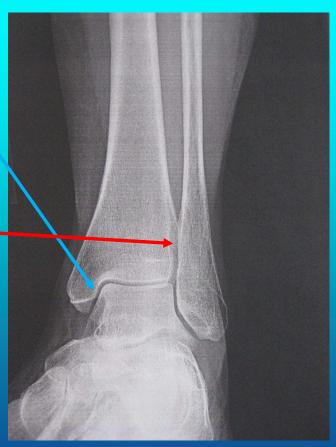

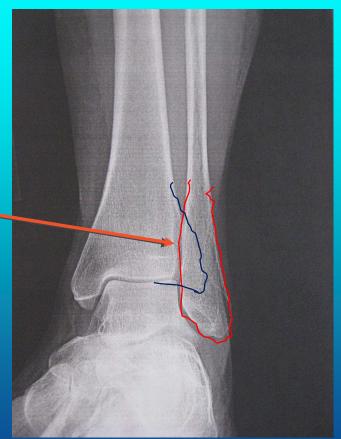

Radiographs

- Ankle (medial) clear space
 - Normal range <4 mm between tibia
- Tibiofibular clear space
 - Normal range <5 mm between tibia & fibula

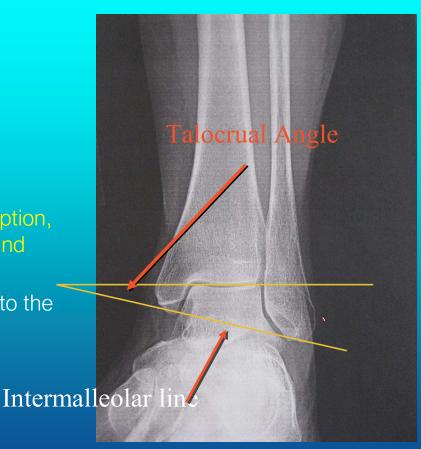

Radiographs

- Tibiofibular overlap
 - Normal range >8-10 mm between tibia & fibula
 - Fibular notch

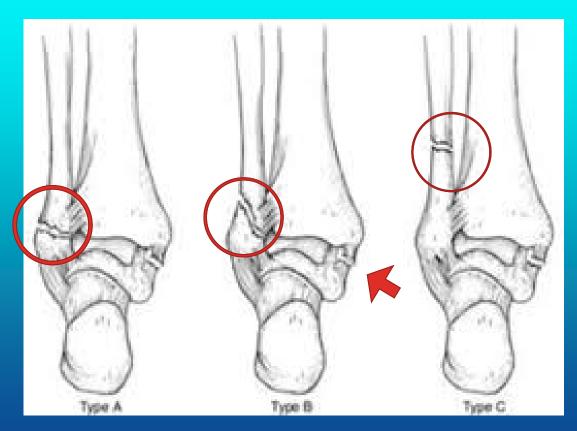

Radiographs

- Talocrual Angle
 - Normal measurement 8-15 degrees
 - Strong indicator of syndesmosis disruption, because the fibula will be shortened and externally rotated
 - Talocrual Angle should be compared to the contralateral normal side

Ankle Fx

WEBER Classification

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Ankle Fx

- Unimalleolar Fx 68%
 - Isolated Fibular fx
 - Normal Mortise
- Bimalleolar Fx 25%
 - Medial & Lateral Malleolus
 - Bimalleolar equivalent Fibula Fx & Medial Ligament injury
 - Wide Mortise?
- Trimalleolar Fx
 - Medial-Lateral-Posterior
 - Wide Mortise
- Ankle Fx/Dislocation
 - Disruption Ankle Mortise
 - · Talus displaces from Plafond
 - Look @ Syndesmosis

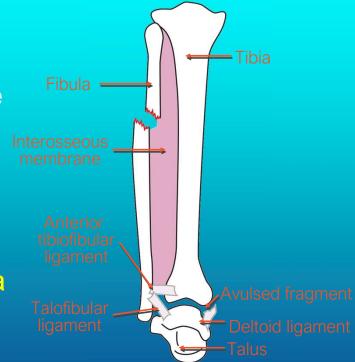

Maisonneuve's Fracture

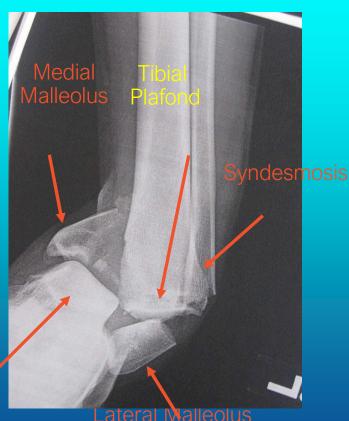

- Maisonneuve's fracture involves fracture of the proximal fibula
- Associated medial Malleolus fracture
 - Deltoid ligament injury and/or
 - Injury to the syndesmosis
 - Medial malleolus fracture & force transmitted through interosseous membrane and exits at proximal fibula
 - Do not assume medial malleolus fractures is isolated
 - Palpate proximal Fibula

Ankle Fracture-Dislocation

- Associated with Bimalleolar or Trimalleolar ankle fractures
- Talus and foot translated completely out of mortise
- Obvious deformity to ankle and foot
- · Open vs. Closed
- Play close attention to pre & post reduction neuro and vascular exams

 Talus

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Ankle Fx/Dislocation

REDUCTION AS SOON AS POSSIBLE PROTECTS SKIN

Ankle Fx/Dislocation

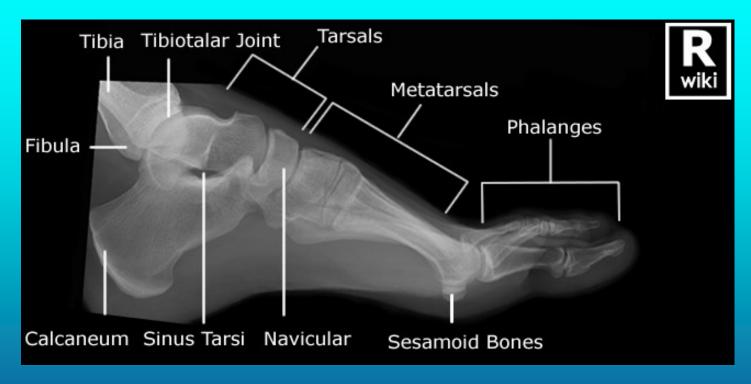

- Knee flexion relaxes effects of Gastroc
 - Water ski traction
 - Reduction
 - Dangle ankle over the edge of the table
- Hold reduction while splint applied and Dries
 - Hold Big Toe and Internal rotation
 - · Posterior & Sugar-tong/stirrup splint
- Check Neurovascular frequently
- Post reduction x-ray

Foot Anatomy

Images courtesy Michael J. Fuller-WikiRadology

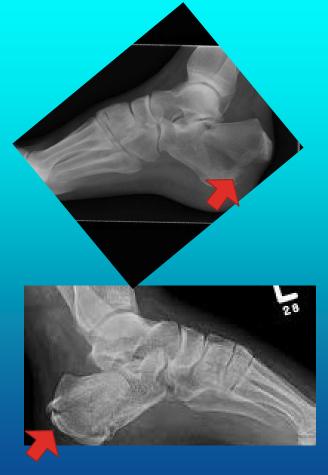

Images courtesy Michael J. Fuller-WikiRadology

Calcaneous fx

Calcaneous Fractures

- Common tarsal bone fracture
- 65-75% fx intra-articular
- 17% open fx
- · High energy mechanism
 - tends to have poor outcomes
- Men > Women
- Associated injuries
- Lumbar Spine fractures
- Femur/Pelvis fractures
- Contralateral Calcaneous fx
- Watch for Tarsal Tunnel syndrome
- Watch for foot compartment syndrome
- Mondor sign- plantar bruising

Calcaneal Fracture

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Calcaneous Fracture

- Initial Treatment:
 - Assess for associated Injuries
 - RICE
 - Bulky padded dressing and splint
 - · helps decrease swelling
 - Reduces soft tissue injury
 - Fx Blisters common occurrence ("bacterial cesspools")
 - NWB
 - Compliance Issues
 - Poor: Bulky padded splint, admit

 RICE Skin checks –
 Surgery at appropriate time
 - Reliable: Bulky padded splint, D/C- RICE- skin check office one week – Surgery at appropriate time
 - · Encourage smoking sensation, blood sugar control, good nutrition

Lisfranc Injury

Lisfranc Fracture

- <u>Defined</u>: disruption in articulation 2nd (medial) cuneiform & base second metatarsal leading to disruption TMT joint complex
- Age- 30"s
- Males>females
- MVAs, falls from height, and athletic injuries
- · Injury mechanism:
 - · caused by rotational forces & axial load, forefoot Hyperplantar flexed

Radiographs

- Foot: AP, LATERAL & OBLIQUE
 - WT-BEARING –best to assess:
 - Hallux valgus angle (HVA)
 - Intermetatarsal angle (IMA)
 - CHARCOT foot
 - Lis-franc pain/swelling allows
- Key x-ray signs indicating Lisfranc injury
 - Malaligned 1-2-3 MT -cuneiforms
 - Malaligned 4TH & 5TH MT-CUBOID
 - Widening space Great and 2nd metatarsal
 - Dorsal subluxation MT base (lateral)
 - Disruption Medial column

Lisfranc Fracture

Normal x-ray

Obvious

Subtle Injury

Lisfranc Fractures

Physical Examination:

History

- Unable to wt bear
- "told they had a sprained foot"
- "negative x-rays"

Exam

- plantar bruising -- Mondor sign
- · swelling throughout midfoot
- · tenderness over tarsometatarsal joint
- · Loss of motion & stability

Treatment

- Similar to Calcaneous/Talus Fx
- Most require surgical intervention

© 2022 ORTHOPAEDIC EDUCATIONAL SERVICES, INC. ALL RIGHTS RESERVED

Metatarsal Fx

- · Metatarsal fractures common injuries of the foot
- 5th metatarsal most commonly fractured
- 2nd and 5th decade of life
- 3rd metatarsal fractures rarely occur in isolation
 - fracture of 2nd or 4th metatarsal
- · Most trauma related to crush injury or direct blow
- · Most are non or minimally displaced/angulated
- Intact Great toe & 5th Metatarsal leads to stability of fx central 3 Metatarsals
- When fx displace-plantar direction
 - 2nd to pull by toe flexors & intrinsic muscles

Radiographs

- Most oblique or transverse fx pattern
- More displacement at neck 2nd to flexor & intrinsic muscle
- > displacement & angulation if 1st MT fx
- <20 degrees varus/valgus angulation acceptable
- > 4mm plantar/dorsal displacement reduce
- > 10 degrees dorsal angulation reduce

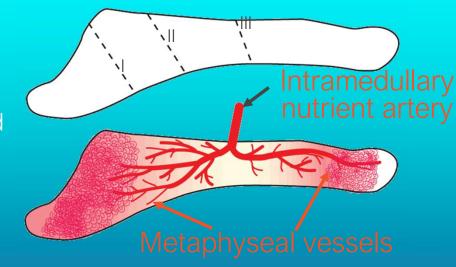

- Treatment
 - Monitor foot compartment syndrome
 - Well padded Jones dressing & splint/fx boot/ post op shoe
 - Neuro/vascular checks
 - NWB WBAT depending on fx and swelling
 - FX beyond acceptable limits
 - Finger/toe traps for closed reduction and splint
 - Repeat x-ray good alignment then can D/C
 - Make NWB till follow up exam

- Unable to improve alignment
 - Manipulate under anesthesia/ankle block
 - Closed reduction and reassess
 - CRPP and reassess
 - Padded dressing and splint/fx boot
- Healing time all FX
 - 4-6 weeks
 - Associated factors can slow or impede healing

5th Metatarsal Fractures

- 3 Zones base 5th MT
- Zone I- articular surface for the metatarsocuboid joint
- Zone II articulation of the 4th and 5th metatarsals (Jones Fracture)

Zone III – extends 1.5 cm distal to zone II

Dameron, TB: Fractures of the Proximal Fifth Metatarsal: Selecting the best Treatment option; JAAOS 3(2), March/April 1995.

5th Metatarsal Fracture

- Zone I
 - Most proximal and is considered the base of the 5th MT
 - · Peroneus Brevis and lateral cord of plantar aponeurosis
 - Fx starts lateral cortex and extends medially into the metatarsocuboid joint
 - Good healing associated w/ Zone I injuries
 - X-ray > 3mm dorsal displacement may need surgical fixation
 - Symptoms subside long before healing seen on x-ray
 - Asymptomatic non-union not uncommon

5th Metatarsal Fracture

- Zone II
 - More distal part tuberosity
 - Strong ligament attachment dorsal / plantar for 4th-5th MT
 - Fx this area extend into articulation of 4-5 MT
 - More painful than zone I injury
 - Symptoms dependant on activity level
 - No improvement on healing WBAT vs. non-Wt-bear Controversial
 - Higher incidence asymptomatic non-union

5th Metatarsal Fracture

- Zone III
 - Most often assoc w/ stress fx mechanism
 - Fx distal to ligament attachment binding 4/5 MT together
 - Slow healing
 - Responds better to ORIF
 - Intramedullary 4.5 cancellous lag screw
 - Non-union may need grafting
 - SLWC 4-6 wks

Toe Fx

Toe Fractures

- Toe Fx Account for < 7% all fx seen in Primary care setting
- Lesser Toe fx 4x m ore likely vs Great toe fx
- Most Lesser Toe fx are non-displaced
- Great toes Fx
 - involves >25% articular surface need close F/U & ? Surgery
 - Comminuted
 - Displaced
- Injury Mechanism:
 - Axial load Jammed toe
 - Crush injury
 - Jt. Hyperextension

Toe Fracture

Radiology

- 3 views: AP, Lateral, Oblique
- Clear views of injured toes
 - Spiral & Transverse fx angular deformity
 - Oblique fx shortening
 - Avulsion fx
- Post –reduction images as needed
- Treatment
 - Open fx go to the OR/ABX/Tetanus
 - Reduce angulated/deformed toes
 - · Digital/hematoma block as needed
 - Buddy Tape
 - Post op Shoe
 - Follow up 1 Week

Fracture Great Toe Proximal Phalanx
